

iMow®. You Relax.

What is Your Time Worth?

Time spent with the family instead of mowing the lawn...priceless.

OFFSET DRIVE HOME

By default, the robotic mower travels back home to the docking station along the perimeter wire. If required, and depending on the edge of the mowing area, you can also set the mower to travel at an offset of 0.3 to 0.7 m to the perimeter wire. Please take into account any necessary additional installation materials when laying corridors (e.g.: wiring set AED 600)

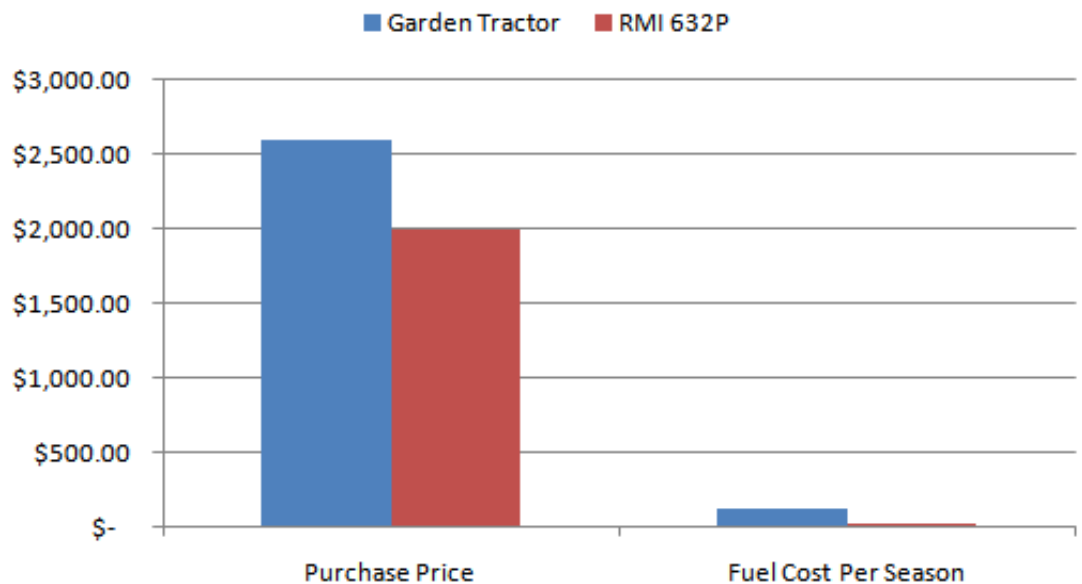

BRIGHT LCD DISPLAY

Not only can all the necessary settings be entered intuitively via the screen, thanks to its high-contrast, bright display, it can also be used in strong sunlight. On the MI 6 models, the display can also be removed as a console to facilitate programming without having to bend down.

MOVEABLE HOOD

The hood of the iMow robotic mower is movable and features sensors for detecting obstacles. If the machine bumps against an obstacle, the impact forces are deflected along the hood and the robotic mower immediately changes direction. If the hood is lifted, the blades stop.

	Tractor	RMI 632P
